# Informatics 1: Data \& Analysis <br> Lecture 19: $\chi^{2}$ Testing on Categorical Data 

Ian Stark<br>School of Informatics<br>The University of Edinburgh

Tuesday 22 March 2016
Semester 2 Week 10

## Unstructured Data

## Data Retrieval

- The information retrieval problem
- The vector space model for retrieving and ranking

## Statistical Analysis of Data

- Data scales and summary statistics
- Hypothesis testing and correlation
- $\chi^{2}$ tests and collocations also chi-squared, pronounced "kye-squared"

## Unstructured Data

## Data Retrieval

- The information retrieval problem
- The vector space model for retrieving and ranking

## Statistical Analysis of Data

- Data scales and summary statistics
- Hypothesis testing and correlation
- $\chi^{2}$ tests and collocations also chi-squared, pronounced "kye-squared"

## Timetable

This is Teaching Week 10 of Semester 2, next week is Week 11, and the teaching block ends on Friday 1 April

Inf1-DA has the following events remaining:

- Friday 25 March: Lecture 20. Review of exam arrangements; summary of topics covered in the course; revision of specific topics.
- Tuesday 27 March: Final Lecture. Review of past exam questions.
- Monday 26 March - Wednesday 28 March: Final tutorial. return of coursework assignment, feedback and discussion on that.

## Which topics to cover in revision lectures?

Speak your brains: http://is.gd/da16revision

## Review: Correlation Coefficient

The correlation coefficient $\rho$ is a way to measure how closely two datasets $x_{1}, \ldots, x_{N}$ and $y_{1}, \ldots, y_{N}$ are related to each other.

Take $\mu_{x}$ and $\sigma_{x}$ the mean and standard deviation of the $x_{i}$ values.
Take $\mu_{y}$ and $\sigma_{y}$ the mean and standard deviation of the $y_{i}$ values.
The correlation coefficient $\rho_{x, y}$ is then computed as:

$$
\rho_{x, y}=\frac{\sum_{i=1}^{N}\left(x_{i}-\mu_{x}\right)\left(y_{i}-\mu_{y}\right)}{N \sigma_{x} \sigma_{y}}
$$

Values of $\rho_{x, y}$ always lie between -1 and 1 .
If $\rho_{x, y}$ is close to 0 then this suggests there is no correlation.
If $\rho_{x, y}$ is nearer +1 then this suggests $x$ and $y$ are positively correlated.
If $\rho_{x, y}$ is closer to -1 then this suggests $x$ and $y$ are negatively correlated.

## Review: Correlation Coefficient

Visualisation and Anscombe's Quartet (1973)

| Data set 1 |  |
| ---: | ---: |
| $x$ | $y$ |

## Review: Hypothesis Testing for Correlation

So far, we have the following procedure to identify correlation between two series of data.

- Draw a scatter plot. Does it look as though there is a relationship between the two variables?
- Calculate a correlation coefficient R.
- Look in a table of critical values to see whether $R$ is large, given the number of data points.
- If $R$ is above the critical value for some chosen $p$, say 0.05 or 0.01 , then this may be judged statistically significant and lead us to reject the null hypothesis.

## Review: Problems With "Significance"

- The value $p$ is the probability of seeing certain results if the null hypothesis were true.
It is not the probability that the null hypothesis is true.
- It doesn't say whether an observed variation is actually "significant" (that's measured by "effect size").
It is really about whether it is statistically detectable.
- Events with $p<0.05$ happen all the time. Well, 1 time in 20. Seeing a low p-value is perhaps evidence to suggest an effect. It's a reason to do another experiment, or make a prediction.

Despite this, hypothesis testing can still serve as evidence of correlation and even causality:

- Postulate a mechanism, propose a hypothesis, make predictions, then carry out repeated experiments to confirm or refute the hypothesis.

## The Reproducibility Problem / Replication Crisis

``` That's a problem.

\section*{The Reproducibility Problem / Replication Crisis}

Open Science Collaboration.
Estimating the Reproducibility of Psychological Science.
Science, 349(6521), 2015
DOI: \(10.1126 /\) science.aac4716

\section*{Abstract}

Reproducibility is a defining feature of science, but the extent to which it characterizes current research is unknown. We conducted replications of 100 experimental and correlational studies published in three psychology journals ... Ninety-seven percent of original studies had significant results ( \(p<.05\) ). Thirty-six percent of replications had significant results ...

\section*{NATURE | NEWS}

Psychology's reproducibility problem is exaggerated - say psychologists

Reanalysis of last year's enormous replication study argues that there is no need to be so pessimistic.

\section*{The \(\chi^{2}\) Test}

We have just seen the correlation coefficient, a useful test to identify whether or not an apparent correlation between variables is statistically significant.

However, the correlation coefficient is only applicable to quantitative data. (A variant, the Spearman rank correlation coefficient, can also be applied to ordinal data.)

The \(\chi^{2}\) test is statistical tool for assessing correlations in categorical data.
This rest of this lecture will go through the calculations for a \(\chi^{2}\) test, using three example sets of data:
- Student results for Inf1-DA in 2010/2011;
- Bigram frequency in the British National Corpus;
- Student admissions to the University of California, Berkeley in 1973.

\section*{Example: Student Exam Results}

\section*{Question}

Is there any correlation, in a class of students enrolled on a course, between submitting the coursework assignment and obtaining grade \(A\) ( \(70 \%\) or higher) on the exam for that course?

The data we will use is the actual performance of those students who took the Informatics 1: Data \& Analysis exam in May 2011.

\section*{Example: Student Exam Results}

\section*{Question}

Is there any correlation, in a class of students enrolled on a course, between submitting the coursework assignment and obtaining grade \(A\) ( \(70 \%\) or higher) on the exam for that course?

Our analysis follows the usual pattern of a statistical test:
- The null hypothesis here is that there is no relationship between coursework submission and exam grade \(A\).
- The \(\chi^{2}\) test indicates the probability \(p\) that data of the kind we actually see would turn up if the null hypothesis were true.
- If \(p\) is low, then we reject the null hypothesis and conclude that there is a correlation between coursework submission and exam grade \(A\).

\section*{Contingency table}

\section*{Frequencies}
\[
\begin{array}{c|cc}
\mathrm{O}_{\mathrm{ij}} & \mathrm{cw} & \neg \mathrm{cw} \\
\hline \mathrm{~A} & \mathrm{O}_{11} & \mathrm{O}_{12} \\
\neg \mathrm{~A} & \mathrm{O}_{21} & \mathrm{O}_{22}
\end{array}
\]
\(\mathrm{O}_{11}\) is the number of students who submitted coursework and obtained an A grade.
\(\mathrm{O}_{12}\) is the number of students who did not submit coursework and obtained an A grade.
\(\mathrm{O}_{21}\) is the number of students who submitted coursework and did not obtain an A grade.
\(\mathrm{O}_{22}\) is the number of students who did not submit coursework and did not obtain an A grade.

\section*{Contingency table}

\section*{Frequencies}
\[

\]

42 is the number of students who submitted coursework and obtained an A grade.

7 is the number of students who did not submit coursework and obtained an A grade.

49 is the number of students who submitted coursework and did not obtain an A grade.

19 is the number of students who did not submit coursework and did not obtain an A grade.

\section*{\(\chi^{2}\) Test Intuition}

We have a table of observed frequencies \(\mathrm{O}_{\mathfrak{i j}}\), and from these we calculate expected frequencies \(\mathrm{E}_{\mathrm{ij}}\) - the numbers we would expect to see if the null hypothesis were true.

The \(\chi^{2}\) value is calculated by comparing the actual frequencies to the expected frequencies.

The larger the discrepancy between these two, the less probable it is that observations like this would occur were the null hypothesis true.

More precisely, if the null hypothesis were true, then the \(\chi^{2}\) value would vary according to the distribution shown on the next slide.

If the \(\chi^{2}\) is significantly large then we reject the null hypothesis.

\section*{Graph of \(\chi^{2}\) Distribution}

\section*{Graph of \(\chi^{2}\) Distribution}

\section*{Graph of \(\chi^{2}\) Distribution}

\section*{Marginals}

\section*{Observed}
\begin{tabular}{c|cc|c}
\(\mathrm{O}_{\mathrm{ij}}\) & cw & \(\neg \mathrm{cw}\) & \\
\hline A & \(\mathrm{O}_{11}\) & \(\mathrm{O}_{12}\) & \(\mathrm{R}_{1}\) \\
\(\neg \mathrm{~A}\) & \(\mathrm{O}_{21}\) & \(\mathrm{O}_{22}\) & \(\mathrm{R}_{2}\) \\
\hline & \(\mathrm{C}_{1}\) & \(\mathrm{C}_{2}\) & N
\end{tabular}
\(\mathrm{R}_{1}=\mathrm{O}_{11}+\mathrm{O}_{12}\) is the number of students who obtained an \(A\) grade.
\(\mathrm{R}_{2}=\mathrm{O}_{21}+\mathrm{O}_{22}\) is the number of students who did not obtain an \(A\) grade.
\(\mathrm{C}_{1}=\mathrm{O}_{11}+\mathrm{O}_{21}\) is the number of students who submitted coursework.
\(\mathrm{C}_{2}=\mathrm{O}_{21}+\mathrm{O}_{22}\) is the number of students who did not submit coursework.
N is the total number of students in the data set.

\section*{Expected Frequencies}

\section*{Expected}
\begin{tabular}{c|cc|c}
\(\mathrm{E}_{i j}\) & cw & -cw & \\
\hline A & \(\mathrm{E}_{11}\) & \(\mathrm{E}_{12}\) & \(\mathrm{R}_{1}\) \\
-A & \(\mathrm{E}_{21}\) & \(\mathrm{E}_{22}\) & \(\mathrm{R}_{2}\) \\
\hline & \(\mathrm{C}_{1}\) & \(\mathrm{C}_{2}\) & N
\end{tabular}

If there were no relationship between coursework submission and exam grade \(A\), then we would expect to see the number of students with both being
\[
E_{11}=\frac{R_{1}}{N} \times \frac{C_{1}}{N} \times N=\frac{R_{1} C_{1}}{N}
\]
and similarly for other values
\[
E_{12}=\frac{R_{1} C_{2}}{N} \quad E_{21}=\frac{R_{2} C_{1}}{N} \quad E_{22}=\frac{R_{2} C_{2}}{N} .
\]

\section*{Computing \(\chi^{2}\)}

\section*{Observed}
\begin{tabular}{c|cc|c}
\(\mathrm{O}_{\mathrm{ij}}\) & cw & -cw & \\
\hline A & \(\mathrm{O}_{11}\) & \(\mathrm{O}_{12}\) & \(\mathrm{R}_{1}\) \\
-A & \(\mathrm{O}_{21}\) & \(\mathrm{O}_{22}\) & \(\mathrm{R}_{2}\) \\
\hline & \(\mathrm{C}_{1}\) & \(\mathrm{C}_{2}\) & N
\end{tabular}

\section*{Expected}
\begin{tabular}{c|cc|c}
\(\mathrm{E}_{\mathrm{ij}}\) & cw & \(\neg \mathrm{cw}\) & \\
\hline A & \(\mathrm{E}_{11}\) & \(\mathrm{E}_{12}\) & \(\mathrm{R}_{1}\) \\
\(\neg \mathrm{~A}\) & \(\mathrm{E}_{21}\) & \(\mathrm{E}_{22}\) & \(\mathrm{R}_{2}\) \\
\hline & \(\mathrm{C}_{1}\) & \(\mathrm{C}_{2}\) & N
\end{tabular}

The \(\chi^{2}\) statistic for a contingency table in general is defined as
\[
\chi^{2}=\sum_{i, j} \frac{\left(O_{i j}-E_{i j}\right)^{2}}{E_{i j}}
\]
which for a \(2 \times 2\) table expands to
\[
=\frac{\left(O_{11}-E_{11}\right)^{2}}{E_{11}}+\frac{\left(O_{12}-E_{12}\right)^{2}}{E_{12}}+\frac{\left(O_{21}-E_{21}\right)^{2}}{E_{21}}+\frac{\left(O_{22}-E_{22}\right)^{2}}{E_{22}}
\]

For a \(2 \times 2\) table the four numerators are always equal. Why?

\section*{Worked Example}

\section*{Observed}
\begin{tabular}{c|cc|l}
\(\mathrm{O}_{\mathrm{ij}}\) & cw & \(\neg \mathrm{cw}\) & \\
\hline A & 42 & 7 & \\
\(\neg \mathrm{~A}\) & 49 & 19 & \\
\hline & & &
\end{tabular}

\section*{Expected}

The \(\chi^{2}\) statistic for this contingency table is
\[
\chi^{2}=\frac{\left(O_{11}-E_{11}\right)^{2}}{E_{11}}+\frac{\left(O_{12}-E_{12}\right)^{2}}{E_{12}}+\frac{\left(O_{21}-E_{21}\right)^{2}}{E_{21}}+\frac{\left(O_{22}-E_{22}\right)^{2}}{E_{22}}
\]

\section*{Worked Example}

\section*{Observed}
\begin{tabular}{c|cc|c}
\(\mathrm{O}_{\mathrm{ij}}\) & cw & \multicolumn{2}{|c|}{} \\
\hline A & 42 & 7 & 49 \\
\(\neg \mathrm{~A}\) & 49 & 19 & 68 \\
\hline & 91 & 26 & 117
\end{tabular}

\section*{Expected}

The \(\chi^{2}\) statistic for this contingency table is
\[
\chi^{2}=\frac{\left(O_{11}-E_{11}\right)^{2}}{E_{11}}+\frac{\left(O_{12}-E_{12}\right)^{2}}{E_{12}}+\frac{\left(O_{21}-E_{21}\right)^{2}}{E_{21}}+\frac{\left(O_{22}-E_{22}\right)^{2}}{E_{22}}
\]

\section*{Worked Example}

\section*{Observed}
\begin{tabular}{c|cc|c}
\(\mathrm{O}_{\mathrm{ij}}\) & cw & cw & \\
\hline A & 42 & 7 & 49 \\
\(\neg \mathrm{~A}\) & 49 & 19 & 68 \\
\hline & 91 & 26 & 117
\end{tabular}

\section*{Expected}
\begin{tabular}{c|cc|c}
\(\mathrm{E}_{\mathrm{ij}}\) & cw & \(\neg \mathrm{cw}\) & \\
\hline A & & & 49 \\
\(\neg \mathrm{~A}\) & & & 68 \\
\hline & 91 & 26 & 117
\end{tabular}

The \(\chi^{2}\) statistic for this contingency table is
\[
\chi^{2}=\frac{\left(O_{11}-E_{11}\right)^{2}}{E_{11}}+\frac{\left(O_{12}-E_{12}\right)^{2}}{E_{12}}+\frac{\left(O_{21}-E_{21}\right)^{2}}{E_{21}}+\frac{\left(O_{22}-E_{22}\right)^{2}}{E_{22}}
\]

\section*{Worked Example}

\section*{Observed}
\begin{tabular}{c|cc|c}
\(\mathrm{O}_{\mathrm{ij}}\) & cw & cw & \\
\hline A & 42 & 7 & 49 \\
\(\neg \mathrm{~A}\) & 49 & 19 & 68 \\
\hline & 91 & 26 & 117
\end{tabular}

\section*{Expected}
\begin{tabular}{c|cc|c}
\(\mathrm{E}_{\mathrm{ij}}\) & cw & \(\neg \mathrm{cw}\) & \\
\hline A & 38.11 & & 49 \\
\(\neg \mathrm{~A}\) & & & 68 \\
\hline & 91 & 26 & 117
\end{tabular}

The \(\chi^{2}\) statistic for this contingency table is
\[
\chi^{2}=\frac{\left(O_{11}-E_{11}\right)^{2}}{E_{11}}+\frac{\left(O_{12}-E_{12}\right)^{2}}{E_{12}}+\frac{\left(O_{21}-E_{21}\right)^{2}}{E_{21}}+\frac{\left(O_{22}-E_{22}\right)^{2}}{E_{22}}
\]

\section*{Worked Example}

\section*{Observed}
\begin{tabular}{c|cc|c}
\(\mathrm{O}_{\mathrm{ij}}\) & cw & \(\neg \mathrm{cw}\) & \\
\hline A & 42 & 7 & 49 \\
\(\neg \mathrm{~A}\) & 49 & 19 & 68 \\
\hline & 91 & 26 & 117
\end{tabular}

\section*{Expected}
\begin{tabular}{c|cc|c}
\(\mathrm{E}_{\mathrm{ij}}\) & cw & \(\neg \mathrm{cw}\) & \\
\hline A & 38.11 & 10.89 & 49 \\
\(\neg \mathrm{~A}\) & 52.89 & & 68 \\
\hline & 91 & 26 & 117
\end{tabular}

The \(\chi^{2}\) statistic for this contingency table is
\[
\chi^{2}=\frac{\left(O_{11}-E_{11}\right)^{2}}{E_{11}}+\frac{\left(O_{12}-E_{12}\right)^{2}}{E_{12}}+\frac{\left(O_{21}-E_{21}\right)^{2}}{E_{21}}+\frac{\left(O_{22}-E_{22}\right)^{2}}{E_{22}}
\]

\section*{Worked Example}

\section*{Observed}
\begin{tabular}{c|cc|c}
\(\mathrm{O}_{\mathrm{ij}}\) & cw & \(\neg \mathrm{cw}\) & \\
\hline A & 42 & 7 & 49 \\

\hline & 91 & 26 & 117
\end{tabular}

\section*{Expected}
\begin{tabular}{c|cc|c}
\(\mathrm{E}_{\mathrm{ij}}\) & cw & \(\neg \mathrm{cw}\) & \\
\hline A & 38.11 & 10.89 & 49 \\
\(\neg \mathrm{~A}\) & 52.89 & 15.11 & 68 \\
\hline & 91 & 26 & 117
\end{tabular}

The \(\chi^{2}\) statistic for this contingency table is
\[
\begin{aligned}
\chi^{2} & =\frac{\left(O_{11}-E_{11}\right)^{2}}{E_{11}}+\frac{\left(O_{12}-E_{12}\right)^{2}}{E_{12}}+\frac{\left(O_{21}-E_{21}\right)^{2}}{E_{21}}+\frac{\left(O_{22}-E_{22}\right)^{2}}{E_{22}} \\
& =\frac{(42-38.11)^{2}}{38.11}+\frac{(7-10.89)^{2}}{10.89}+\frac{(49-52.89)^{2}}{52.89}+\frac{(19-15.11)^{2}}{15.11} \\
& =\frac{3.89^{2}}{38.11}+\frac{-3.89^{2}}{10.89}+\frac{-3.89^{2}}{52.89}+\frac{3.89^{2}}{15.11} \\
& =3.09
\end{aligned}
\]

\section*{Graph of \(\chi^{2}\) Distribution}

\section*{Critical Values for \(\chi^{2}\)}

These are the critical values for different significance levels of the \(\chi^{2}\) distribution for a \(2 \times 2\) table.
\[
\begin{array}{c|llll}
p & 0.10 & 0.05 & 0.01 & 0.001 \\
\hline \chi^{2} & 2.71 & 3.84 & 6.64 & 10.83
\end{array}
\]

This means that if the null hypothesis were true then:
- The probability of the \(\chi^{2}\) value exceeding 2.71 would be \(p=0.1\).
- The probability of the \(\chi^{2}\) value exceeding 3.84 would be \(p=0.05\).
- The probability of the \(\chi^{2}\) value exceeding 6.64 would be \(p=0.01\).
- The probability of the \(\chi^{2}\) value exceeding 10.83 would be \(p=0.001\).

\section*{Critical Values for \(\chi^{2}\)}

These are the critical values for different significance levels of the \(\chi^{2}\) distribution for a \(2 \times 2\) table.
\[
\begin{array}{c|llll}
p & 0.10 & 0.05 & 0.01 & 0.001 \\
\hline \chi^{2} & 2.71 & 3.84 & 6.64 & 10.83
\end{array}
\]

In this case \(\chi^{2}=3.09\), meaning \(0.10>p>0.05\). This is evidence to suggest that there is a correlation, and we reject the null hypothesis at the \(90 \%\) level. The result is statistically significant.

It appears that in this data there is a correlation between submitting the coursework and achieving an A grade in the exam. Of course, this does not tell us whether there is any causal link, either between these outcomes or from some third factor. What it does do is give a hypothesis that we could explore in further data.

\section*{Additional Features of \(\chi^{2}\) Tests}

\section*{Degrees of Freedom}

In tables of critical values for the \(\chi^{2}\) distribution, entries are usually classified by degrees of freedom. An \(m\) by \(n\) contingency table has \((m-1) \times(n-1)\) degrees of freedom - given fixed marginals, once there are \((m-1) \times(n-1)\) entries in the table the remaining \((m+n-1)\) entries are forced.

A 2 by 2 table has only one degree of freedom, and the table on the previous slide gave the critical values for a \(\chi^{2}\) distribution with one degree of freedom.

\section*{Additional Features of \(\chi^{2}\) Tests}

\section*{Low Frequencies}

The statistics underlying the \(\chi^{2}\) test become inaccurate when expected frequencies are small.

Reasons include: inevitable differences up to 0.5 as observed values can only be whole numbers; and that \(\chi^{2}\) is only an approximation to the exact (but computationally more expensive) distribution.

The test is usually considered unreliable for a \(2 \times 2\) table if any cell has expected value below 5 ; or for a larger table, if more than \(20 \%\) of cells have expected value below 5 .

> That's really just a rule of thumb: opinions vary on what are appropriate limits here

For these cases there are more refined methods such as Fisher's Exact Test.

\section*{Example: Collocations}

Recall that a collocation is a sequence of words that occurs atypically often in a language. For example: "run amok", "strong tea", "make do".

So far, we haven't looked at what exactly "atypically often" might mean.
The \(\chi^{2}\) test is one way to approach this, and we shall use it to assess whether the bigram "make do" appears atypically often in the \(10^{8}\) words of the British National Corpus (BNC).

The null hypothesis will be that the two words "make" and "do" appear together just as often as would be expected by chance, given their individual frequencies in the corpus.

If we reject this hypothesis, then we might take this as evidence of "make do" being a collocation.

\section*{Contingency table}

\section*{Bigram Frequencies}
\begin{tabular}{c|cc}
\(\mathrm{O}_{\mathrm{ij}}\) & \(w_{1}\) & \(\neg w_{1}\) \\
\hline\(w_{2}\) & \(\mathrm{O}_{11}=\mathrm{f}\left(w_{1} w_{2}\right)\) & \(\mathrm{O}_{12}=\mathrm{f}\left(\neg w_{1} w_{2}\right)\) \\
\(\neg w_{2}\) & \(\mathrm{O}_{21}=\mathrm{f}\left(w_{1} \neg w_{2}\right)\) & \(\mathrm{O}_{22}=\mathrm{f}\left(\neg w_{1} \neg w_{2}\right)\)
\end{tabular}
\(\mathrm{f}\left(w_{1} w_{2}\right)\) is the frequency of \(w_{1} w_{2}\) in a corpus, the number of times that bigram appears.
\(\mathrm{f}\left(w_{1} \neg w_{2}\right)\) is the number of bigram occurrences where the first word is \(w_{1}\) and the second word is not \(w_{2}\).
\(f\left(\neg w_{1} w_{2}\right)\) is the number of bigram occurrences where the first word is not \(w_{1}\) and the second word is \(w_{2}\).
\(\mathrm{f}\left(\neg \mathfrak{w}_{1} \neg \mathcal{w}_{2}\right)\) is the number of bigram occurrences where the first word is not \(w_{1}\) and the second word is not \(w_{2}\).

\section*{Worked Example}

\section*{Observed}
\begin{tabular}{r|cc|l}

\hline & 77392 & 112103627 & 112181019
\end{tabular}

The \(\chi^{2}\) statistic for this table is 10.02 , which is significant at the \(99 \%\) level.

\section*{Example: Berkeley Admissions}

Following the fall admissions round of students to graduate school at the University of California, Berkeley in 1973, the University was sued for bias against women.

Admission statistics showed that men applying were significantly more likely to be admitted than women applying.

The following table is based on some of those admission statistics.

\section*{Berkeley Admissions}
\begin{tabular}{c|cc|cc} 
& Accepted & Rejected & Applied & Rate \\
\hline Men & 1122 & 1005 & 2127 & \(53 \%\) \\
Women & 511 & 590 & 1101 & \(46 \%\) \\
\hline Total & 1633 & 1595 & 3228 & \(51 \%\)
\end{tabular}

The \(\chi^{2}\) statistic for this table is 11.66 , significant at the \(99.9 \%\) level.

\section*{Not So Simple}

One obvious action is to break down these figures to identify which departments are the source of this bias.

\section*{Faculty Group "S"}
\begin{tabular}{c|cc|c} 
& Accepted & Rejected & Applied \\
\hline Men & 864 & 521 & 1385 \\
Women & 106 & 27 & 133 \\
\hline Total & 970 & 548 & 1518
\end{tabular}

Faculty Group "A"
\begin{tabular}{c|cc|c} 
& Accepted & Rejected & Applied \\
\hline Men & 258 & 484 & 742 \\
Women & 405 & 563 & 968 \\
\hline Total & 663 & 1047 & 1710
\end{tabular}

\section*{Not So Simple}

One obvious action is to break down these figures to identify which departments are the source of this bias.

\section*{Faculty Group "S"}
\begin{tabular}{c|cc|cc} 
& Accepted & Rejected & Applied & Rate \\
\hline Men & 864 & 521 & 1385 & \(62 \%\) \\
Women & 106 & 27 & 133 & \(80 \%\) \\
\hline Total & 970 & 548 & 1518 & \(64 \%\)
\end{tabular}

Faculty Group "A"
\begin{tabular}{c|cc|cc} 
& Accepted & Rejected & Applied & Rate \\
\hline Men & 258 & 484 & 742 & \(35 \%\) \\
Women & 405 & 563 & 968 & \(42 \%\) \\
\hline Total & 663 & 1047 & 1710 & \(39 \%\)
\end{tabular}

Women & 405 & 563 & 968 & \(42 \%\) & \(\chi^{2}=8.84\) \\
\hline Total & 663 & 1047 & 1710 & \(39 \%\) &
\end{tabular}

\section*{Not So Simple}

This curious behaviour is known as Simpson's Paradox. It turns up occasionally in a range of real-life cases; and it is not easily resolved. Judea Pearl argues that the resolution lies in identifying the causal networks in any given situation.

In the Berkeley case, the disparity arose because:
- Subject choice was correlated with gender;
- Competition for places varied substantially between departments.

More detailed investigation suggested no significant bias in admissions committees; but that the bias in aggregated data was linked to real bias in wider cultural expectations and social pressures.
(i. P. J. Bickel, E. A. Hammel, and J. W. O'Connell.

Sex bias in graduate admissions: Data from Berkeley.
Science, 187(4175):398-404, 1975.
